Chapter 1: Project Planning and Management

1.1 Names of Editors/writers of the Report

writers of the Report:

Hutheyfa Ammar 1221065

Ramzi Fiqyat 123174

1.2 Business Title Business: TV shop system

1.3 Group Name:Group Number 11

1.4 Name of students/members

Hutheyfa ammar 1221065

Husam atwan 1222274

Anas ghazawnah 1231504

Mohammad foqahaa 1231402

Ramzi Fiqyat 123174

1.5 Role of each member

Hutheyfa ammar Project manager

Ramzi Fiqyat Secretary & Requirement Engineer

Mohammad foqahaa QA or software Tester

Anas ghazawnah Programmer

Husam atwan Technical architect

1.6 Project management strategy

Meetings: We planned to convene at least once a week as a face-to-face meeting to do specific our meetings primarily done online using Discord .

Decisions: we took everyone's opinion and discuss each one of them, then vote for the best models: we use waterfall in our project

1.7 Project Manager Report

Hutheyfa Abuznaid (Project Manager): Responsible for overall project coordination, setting milestones, managing internal timelines, compiling the final documentation, and drafting this management report.

Ramzi Fiqyat (Secretary & Requirement Engineer): Gathered and documented the functional and non-functional requirements. Formulated the core business scope (120+ TV models, 60+ accessories, sales, delivery, installation, and maintenance) and detailed the "Submit Repair Request" Use Case specification.

Husam atwan (Technical Architect): Modeled the structural and behavioral blueprints of the system. Designed the Overall Use Case Diagram, Activity Diagrams, Sequence Diagrams, and established the 3-layer structural layout (UI Layer, Middle Layer, Infrastructure Layer) via Component and Deployment modeling.

Anas ghazawnah (Programmer): Translated the requirements into the logical architecture by building the Overall Analysis and Detailed Class Models/Diagrams, mapping entities like Orders, Payments, Products, and Warranties into object-oriented modules.

Mohammad Foqahaa (QA / Software Tester): Validated design compliance against non-functional design goals. Formulated structural validation scenarios ensuring strict adherence to low coupling, high cohesion, data integrity thresholds (e.g., preventing stock from dropping below zero), and complete audit logging.

2. Barriers and Challenges Faced

Diagram and Design Synchronization: Ensuring tight alignment between the Use Case specifications, the Activity Diagrams, and the Detailed Class Models proved difficult. For example, syncing the complex logic of the "Submit Repair Request" workflow across the Sequence Diagrams and the structural classes required multiple design iterations.

Balancing Architectural Design Goals: It was a constant challenge to design an architecture that simultaneously maintained low coupling (ensuring the Order and Payment systems remained isolated) while ensuring high cohesion within individual packages like Inventory Management.

Enforcing Non-Functional Constraints: Translating business requirements—such as ensuring real-time low-stock alerts to the Operations Manager and establishing foolproof audit logs to prevent data manipulation—into concrete database and boundary class designs required deep technical oversight.

3. Project Success Evaluation

From an engineering standpoint, the design cleanly fulfills our primary objective: building a scalable, resilient retail model capable of managing extensive inventories (120+ TV models and 65 types of accessories) simultaneously. Our system architecture successfully achieves a modular 3-tier layout (Web Browser, Web Server, and DB Server) which isolates the user interface from business logic and persistent storage. This guarantees that future business expansions—such as integrating alternative payment systems like PayPal—can be completed smoothly without breaking core ordering frameworks. By strictly adhering to solid architectural principles, our team delivered a fully verifiable, robust structural framework ready for real-world development.

1.8 Group Members Report

Technical Architect: Husam Atwan

The project was successfully built with efficiency, following a well-structured strategy. My contributions included engaging in user requirements development and reviewing system requirements. I contributed to the Use-Case Activity Modelling, System and Component Modelling, and System and Deployment Modelling, while also leading the System and Architectural Design. Individually, I wrote the Use-Case Specification and developed the Sequence Diagram.

Programmer: Anas Ghazawnah

Reflecting on this course, I have gained valuable insights into project management and software development, particularly in user requirements gathering and leading system requirements to ensure practical and well-defined specifications. I actively led in effort and time estimation and contributed to System Sequence Modelling and Design goals.

Requirement Engineer: Ramzi Fiqyat

I am proud to evaluate our project as a remarkable success, achieving all objectives with high quality and within the set timeline through excellent teamwork. As the Requirements Engineer, I participated in discussions on System Requirements. I also contributed to key tasks such as Use Case Modelling, Actor Analysis, System Class Modelling, System Component Modelling, and System Deployment Modelling.

QA Tester: Mohammad Foqahaa

As the Quality Assurance Tester, I focused on verifying the alignment between our system design and practical requirements. I authored key Use Case Specifications and detailed Use Case Descriptions to ensure system behavior was fully testable. Furthermore, I closely analyzed and verified the structural integrity of our Sequence Diagrams, Component Diagrams, Deployment Diagrams, and overall Architectural Design Layout to ensure strict adherence to the project's quality metrics.

Manger : Hutheyfa Abuznaid

My primary contributions centered on mapping out the behavioral models and structural rules of the application. I developed explicit Use Case Diagrams and outlined detailed Use Case Descriptions to clarify user-system interactions. Additionally, I designed the Sequence Diagrams and Activity Diagrams to carefully outline core workflows, and generated the comprehensive project documentation along with the system's Class Diagram.

Chapter 2: Requirement Elicitation, Analysis and Modelling

[Leader: Mohammad, Reviewing: Husam, Discussing: Anas, Finalizing: Ramzi, Re-drawing: Huthayfa]

2.1. Requirement statement/Business description.

Our project idea is a television retail store.

- The store carries over 120 television models from five major brands and approximately 60 types of accessories.
- The store offers sales, delivery, installation, and maintenance services.
- For delivery and installation orders, there is a dedicated team to handle the process.
- For repair requests, we have strict policies; every repair request is thoroughly reviewed according to these policies before acceptance or rejection. The store has several departments:

(showroom with reception and sales staff, inventory with warehouse staff, and administration with the store manager and administrative staff).

Modified

UR1 : The Warehouse Clerk shall be able to record newly arrived product shipments into the inventory

UR2 : The Warehouse Clerk shall be able to filter the product catalog

UR3 : The Store Manager shall be able to create employee accounts

UR4 : The Customer shall be able to submit a repair request form .

UR5 : Warehouse Clerk shall be able to flag specific items as damaged or missing.

UR6 : The Customer shall be able to submit return request for purchased products.

UR7 : The Pricing Manager should be able to update product pricing, discounts, selling prices, and purchase prices.

UR8 : The Customer shall be able to place orders for products and services.

UR9 : The Customer shall be able to provide delivery details for their orders.

UR10: The Customer shall be able to view the status of their orders, deliveries, and repair requests.

Modified

[LeaderMohammad:, Reviewing: Husam, Discussing: Anas, Finalizing: Ramzi, Re-drawing: Hutheyfa]

2.2. USER and SYSTEM requirements .

UR1S

SR1.1 : The system shall receive and store Shipment information entered by Warehouse Clerk.

SR1.2 : The system shall provide the Warehouse Clerk fields to record the product ID, product name, quantity received, supplier, and arrival date.

SR1.3 : The system shall validate that all required shipment information is entered before saving the record.

SR1.4 : The system shall update the inventory quantity when a shipment is successfully recorded.

SR1.5 : The system shall generate a low-stock alert for products below the minimum stock threshold.

SR1.6: The system shall generate a confirmation message after the shipment has been recorded successfully.

UR2S

SR2.1 : The system shall generate the product catalog to the Warehouse Clerk.

SR2.2 : The system shall update the displayed product list according to the selected filter and sorting criteria.

SR2.3 : The system shall generate only products that match the selected filter criteria.

SR2.4 : The system shall provide the sorting option for products in the catalog.

SR2.5 : The system shall provide filtering options for brand, category, and stock availability level in the product catalog.

UR3S

SR3.1 : The system shall provide a form for the Store Manager to enter employee account information.

SR3.2 : The system shall validate that all required fields are completed before creating the account.

SR3.3 : The system shall verify that the username or email address is not already associated with an existing account.

SR3.4 : The system shall assign the selected role and permissions to the employee account.

SR3.5 : The system shall generate a confirmation message when the account is created successfully.

SR3.6 : The system shall generate an error message if account creation fails.

UR4S

SR4.1 : The system shall provide a repair request form for customers.

SR4.2 : The system shall assign a unique repair request number to each submitted request

SR4.3 : The system shall check the receipt number to decide if the TV is still under warranty.

SR4.4 : The system shall validate that all required fields are completed before the form is submitted..

SR4.5 : The system shall notify the Receptionist of the new repair request.

SR4.6 : The system shall set the initial status of the repair request to Pending

UR5S

SR5.1 : The system shall provide the Warehouse Clerk select option to select an item from the inventory.

SR5.2 : The system shall provide options to mark an item as damaged or missing.

SR5.3 : The system shall update the item's availability status after it is marked as damaged or missing.

SR5.4 : The system shall update the inventory records counts when an item's status is changed.

UR6S

SR6.1 : The system shall provide a return request form for customers.

SR6.2 : The system shall assign a unique return request number to each submitted request

SR6.3 : The system shall check the return number to decide if the TV is still under return period.

SR6.4 : The system shall validate that all required fields are completed before the form is submitted.

SR6.5 : The system shall notify the Receptionist of the new return request.

SR6.6 : The system shall set the initial status of the return request to Pending

UR7S

SR-7.1: The system shall provide the Pricing Manager field to enter the purchase price for each product.

SR-7.2: The system shall provide the Pricing Manager field to set the selling price for each product.

SR-7.3: The system shall provide the Pricing Manager field to create promotional discounts and special offers.

SR-7.4: The system shall provide discounted prices to customers when promotions are active.

SR-7.5: The system shall block negative or invalid pricing values

UR8S

SR-8.1 : The system shall record orders for selected products and services.

SR-8.2 : The system shall record delivery information

SR-8.3 : The system shall process payments using supported payment methods and currencies.

SR-8.4 : The system shall validate order information before confirming an order.

SR-8.5 : The system shall support the following currencies: USD,JOD,ILS

SR-8.6 : The system shall notify Receptionist when a new order is placed.

SR-8.7 : The system shall provide the current status of submitted orders.

UR9S

SR-9.1: The system shall receive the customer delivery information.

SR-9.2: The system shall calculate delivery fees based on delivery requirements.

SR-9.3: The system shall associate delivery information with the customer's order.

SR-9.4: The system shall provide delivery details to the delivery team.

SR-9.5: The system shall validate delivery information before order confirmation.

SR-9.6: The system shall generate a delivery confirmation for confirmed orders.

UR10S

SR-10.1 : The system shall provide the current status of customer repair requests , order and delivery.

SR-10.2 : The system shall update status information when changes occur in orders, deliveries, or repair requests.

SR-10.3 : The system shall associate status information with the corresponding customer request.

2.3.:Effort and Cost Estimation:

[Leader:Anas, Reviewing: Mohammad, Discussing: Ramzi, Finalizing: Hutheyfa, Re-drawing: Husam]

pw = person week (1 person working full-time for 1 week)

pm = person month

Effort = the effort required for a person employed all week long

Schedule time = time needed to complete based on working days only

Person-week based estimation with a 30% schedule buffer

User Requirement	Estimated Effort	Estimated No. of Developers	Total Effort
US1	3pw	2	3x2 =6pw
US2	2pw	2	2x2 =4pw
US3	3pw	2	3x2 =6pw
US4	2pw	2	2x2 =4pw
US5	2pw	1	2x1 =2pw
US6	3pw	3	3x3 =9pw
US7	2pw	1	2x1 =2pw
US8	2pw	2	2x2 =4pw
US9	2pw	1	2x1 =2pw
US10	2pw	1	2x1 =2pw

Modified

- 1) Total effort = sum of the Total Effort column = 6+4+6+4+2+9+2+4+2+2 = 41 person-weeks.
- 2) Average team size = total developer assignments / number of requirements = $(2+2+2+2+1+3+1+2+1+1) / 10 = 17 / 10 = 1.7$ developers working concurrently.
- 3) Schedule time = total effort / average concurrent developers = $41 / 1.7 \approx 24$ weeks; with the 30% buffer = $24 \times 1.3 \approx 31$ weeks.
- 4) Weekly salary = \$250 per developer.
- 5) Total development cost = total effort $\times$ weekly salary = $41 \times \$250 = \$10,250$.
- 6) Proposed project price (cost + 40%–65% margin) = \$14,500 – \$17,000; estimated gross profit = price – cost = \$4,250 – \$6,750.

2.4 ACTORS analysis and their description

[Leader: Anas, Reviewing: Ramzi, Discussing: Husam, Mohammad, Finalizing:Hutheyfa]

Primary Actors

Actor	Semantics/Description
Customer	This actor represents someone who uses the website to look at products, place orders, ask for repairs or returns, request delivery, and get invoices.
Warehouse Manager	This actor represents someone who receives new stock, checks product quantities, marks any missing or damaged items, sends low stock alerts to the Operations Manager, and views confirmed orders to prepare them for delivery.
Store Manager	This actor represents someone who manages the employees, manages their shifts, assigns employee roles, and is in charge of hiring new staff, and generating store reports.
Pricing Manager	This actor represents someone who sets and updates the prices of products, applies discounts, and makes sure all prices in the system are correct.
Repairer	This actor represents someone who receives repair requests from customers, checks the product, carries out the needed repairs, and sends a repair status report back to the customer.
Delivery And Installation Team	This actor represents the team that receives delivery and installation details from the system, carries out the delivery and installation at the customer's location, and confirms completion.
Operations Manager	This actor represents someone who receives and approves from the receptionist, assigns requests to staff and receives information from them, and sends store needs to the store manager.
Receptionist	This actor represents someone who receives requests from customers, sends requests to the operational manager, receives information back from staff, and notifies the Store Manager when needed.

Actor	Semantics/Description
Accountant	This actor represents someone who manages the shop budget, records all bills and payments, generates financial reports, and sends reports to the Store Manager.

Secondary Actors

Actor	Semantics/Description
Payment System	This actor represents an external payment service that handles online payments from customers, such as credit cards, PayPal, and Apple Pay.
Company Supplier	This actor represents an external company that delivers products to the shop when new stock is needed.
Email	This actor represents an external email service that the system uses to send verification messages and notifications to users.
Accounting System	This actor represents an external accounting system that works alongside the accountant to manage and process financial data for the shop.

.

2.6 Description of key USE-CASES: One for each group member

UC1: Hutheyfa ammar

UC2: Ramzi Fiyyat

UC3: Mohammad foqahaa

UC4: Anas ghazawnah

UC5: Husam atwan

Case 1 — SUBMIT REPAIR REQUEST

System Name: TV Shop Management System	
Use Case Title	SUBMIT REPAIR REQUEST
Description	The customer shall be able to go to the website and fill out a repair request form with their name, contact number, TV brand and model, description of the problem, and proof of purchase .
Actors	Customer, Repairer, Receptionist, Operations Manager
Data	Customer name, phone number, TV brand, TV model, description of problem, receipt number, warranty status
Stimulus / Trigger	Customer submits the repair request on the website
Pre-conditions	1. Customer has a valid registered account 2. Customer has a receipt number .
Workflow / Flow of Events	1. The customer goes to the maintenance request department on site 2. The customer fills in : name , contact number , TV brand and model , problem description , and receipt number 3. The system verifies the receipt number and purchase date to determine the warranty status 4. If the device is still under warranty, the system accepts the request and creates a maintenance ticket 5. The system displays the maintenance ticket to the responsible employee

	6. The employee reviews the request details and updates the maintenance status 7. The system informs the customer of the status change 8. If the warranty has expired or the damage is due to the customer, the request is rejected
Post-conditions / Response	A repair ticket is created and assigned to the repairer. The customer receives a confirmation notification. The request is stored in the system for tracking and audit purposes.
Comments	If the damage is found to be caused by the customer during inspection, the employee may update the status to Customer Fault and the repair cost will be communicated separately.

Use Case 2 — PLACE ORDER

Use Case Title	PLACE ORDER
Description	User shall be able to order an entire order, and select all the details with the payment method.
Actors	Customer, Payment System, Operations Manager, Receptionist, Warehouse Manager
Data	payment method , payment details.
Stimulus / Trigger	Customer clicks 'Confirm Order' after reviewing order summary.
Pre-conditions	1. Customer has at least one item or service in their order list. 2. Customer is logged in
Workflow / Flow of Events	1. All items and services in the customer's order are displayed to the customer. 2. If there is a delivery, the customer chooses the delivery 3. The customer chooses the payment method, either online payment or cash on delivery. 4. If the customer chooses online payment, the system displays a payment interface. 5. The customer completes the payment using Visa 6. The system checks all required fields before confirmation. 7. The system confirms the order and informs the relevant staff. 8. The customer can track the status of their order. 10. The system generates an invoice and sends it to the customer.
Post-conditions / Response	The order is confirmed, Warehouse Manager receives a notification. An invoice is generated and sent to the customer. Order status is visible in the customer's account.
Comments	The system supports multiple currencies and payment gateways. Onsite payment does not require card details at this stage. The system must prevent order confirmation if any required fields are missing.

Use Case 3 — LOGIN

Use Case Title	LOGIN
Description	The user shall be able to log in to the system using their registered email and password to access their account and the features assigned to their role.
Actors	Customer, Operations Manager, Email
Data	Email address, password, user role, session token, login timestamp
Stimulus / Trigger	User navigates to the login page and submits their credentials
Pre-conditions	1. The user has a registered account in the system. 2. The user's account is active and not locked
Workflow / Flow of Events	1. The user navigates to the login page. 2. The user enters their email address and password. 3. The system Sent verification to Email. 4. If the verification are correct, the system able the use to enter their role-appropriate dashboard. 6. If the verification are incorrect, the system displays an error message
Post-conditions / Response	The user is successfully logged in with an active session. The user is redirected to their role-appropriate dashboard.
Comments	The system Sent verification to customer to log in on the website

Use Case 4 — DELIVERY AND INSTALLATION

Use Case Title	DELIVERY AND INSTALLATION
Description	The Delivery And Installation Team shall be able to receive delivery and installation assignments from the system, carry out the delivery and installation at the customer's location, and confirm completion so the system and customer are updated.
Actors	Delivery And InstallationTeam, Customer, Warehouse Manager
Data	Order ID, customer name, delivery address, scheduled date and time, product details, installation notes, delivery status, completion confirmation.
Stimulus / Trigger	A confirmed order with a delivery or installation service is assigned to the Delivery And InstallationTeam by the system
Pre-conditions	1. The order has been confirmed and payment has been processed. 2. The product has been staged for delivery by the Warehouse Manager. 3. A delivery date and address have been provided by the Customer. 4. The DeliveryAnd InstallationTeam has an active account with delivery access.
Workflow / Flow of Events	1. The system assigns the confirmed order to the Delivery And InstallationTeam and displays the delivery details. 2. The team reviews the assignment: customer name, address, scheduled date, product details, and any installation notes. 3. The team arrives at the customer's location and delivers the product. 4. If installation is required, the team carries out the installation at the customer's location. 5. The team marks the delivery as "Completed" in the system.

Post-conditions / Response	The order status is updated to Delivered. The customer receives a completion notification. The delivery record is stored in the system for tracking and audit purposes.
Comments	Delivery and instillation product is depend on the customer delivery information

Use Case 5 — RECEIVE AND REGISTER NEW STOCK

Use Case Title	RECEIVE AND REGISTER NEW STOCK
Description	The warehouse clerk shall be able to receive new stock, sort and browse existing products by brand, category, or stock level, and stage confirmed products for delivery, with all inventory counts updated automatically and low-stock alerts sent to the OperationsManager when any product falls below the minimum threshold.
Actors	Warehouse Manager, Operations Manager, Company Supplier.
Data	Product brand, model, category, quantity received, supplier name, low-stock threshold, stock change log
Stimulus / Trigger	Warehouse Manager logs in and registers newly arrived stock from supplier
Pre-conditions	1. Warehouse Manager has a valid account with inventory access permissions. 2. Physical stock has arrived from the supplier. 3. Product information is known.
Workflow / Flow of Events	1. The Warehouse Manager logs in and navigates to the Inventory Management section. 2. The manager enters the received stock details: product brand, model, category, quantity, and supplier name. 3. The system immediately updates the inventory database upon submission. 4. The manager reviews the sortable inventory list 5. When a confirmed sale requires a product to be shipped, the manager marks it as Staged for Delivery. 6. The system automatically deducts dispatched quantities from live inventory. 7. The system prevents inventory from dropping below zero 8. If any product falls below the defined minimum stock threshold, the system automatically sends a low-stock alert to the Operations Manager's dashboard. 9. All stock changes are logged.
Post-conditions / Response	The inventory is updated with newly received stock. Dispatched items are linked to delivery orders. Low-stock alerts are sent where applicable. Full audit trail is maintained.

Comments	The system must maintain a minimum capacity of 120 TV models and 65 accessory typess. The audit log is essential for identifying inventory discrepancies and preventing data manipulation.

Chapter 4: System Design and Modelling

[Leader: Anas, Reviewing: Ramzi, Discussing: Mohammed , Finalizing: Husam]

4.1. Description of chosen Design Goals

For the TV Shop Management System, we picked three design goals to guide how we build it. Two of them are general goals that just make any software cleaner and easier to work with, and the third one comes straight from what the shop actually needs to run.

1- Low Coupling

The idea here is that the parts of the system should not depend on each other too much. Our system has a few main parts: Orders, Repairs, Inventory, Payments, and Login. We want it so that changing one part does not break the other parts. For example, if we change how payments work, like adding PayPal next to Visa and cash on delivery, the Order part should keep working without big changes. To do this, each part talks to the others through simple and clear connections, and not by going straight into each other's data. This makes the system much easier to test and fix later.

2- High Cohesion:

This goal is about keeping each part focused on one job. The Inventory part only handles stock, like receiving new items, updating counts, and sending low-stock alerts. The Repair part only handles repair requests and tickets. The Order part only handles placing and tracking orders. We try not to put things that are not related in the same part. When everything inside one part belongs together, it is easier to understand and you make fewer mistakes, because someone who works on repairs does not need to read the order code.

3- Reliability and Data Capacity

This goal comes from our business non-functional requirements. The system must reliably store and manage the shop's inventory and keep correct records. Specifically:

The system must support a minimum capacity of 120 TV models and 65 accessory types at the same time.

Inventory counts must always be correct: the system must never let stock drop below zero, and it must automatically send a low-stock alert to the Operations Manager when product falls below its minimum threshold.

Every stock change and payment must be saved in an audit log, so the shop can find inventory differences and prevent data manipulation.

This goal is important because the shop depends on correct stock and financial records every day. If the data is wrong or lost, customers get wrong orders and the shop loses money. So the design must focus on reliable storage, automatic updates, and a full audit trail.

Name

Student ID

Abed Qabaja 1230511

Omar Naser 1230512

Hala Wahdan 1230689

Doaa Badwan 1230915

Minutes of Meeting

During our meeting on 08/05/2026 at 5:30 PM, we discussed several important points regarding the project requirements and business processes.

Group 1 Members

- Leader: Abed
- QA Tester: Omar
- Secretary: Hala
- Requirement Engineer: Doaa

Group 11 Members

- Leader: Anas
- Reviewing: Mohammad
- Discussing: Ramzi
- Finalizing: Hutheyfa
- Re-drawing: Husam

Discussion Points

1. The order registration process should include essential details that are currently missing, such as the customer's phone number, location, and purchase order information.
1. We discussed the return and exchange policy, including the workflow for each process and the required conditions to ensure there is no conflict with other procedures.
2. One of the main discussion points was the maintenance process. A maintenance request should be submitted electronically, and after company approval, a representative will inspect the product to determine whether the issue is caused by the customer, the company, or the original manufacturer.
3. We also discussed reporting requirements, including the types of reports needed and how frequently they should be generated.
4. In addition, we discussed inventory checking and sorting, especially regarding damaged items and discrepancies in products or data, since this point was not clearly addressed.
